SUMMARY

I am a full stack software engineer who builds .NET and Angular applications on Azure. I started at Optimal Blue as an intern and have been promoted four times, most recently to Level 4 Software Developer. I build real-time features, manage our Azure networking and infrastructure, and pick up new tools quickly. I mentor devs and review code across teams. I am eligible to obtain a U.S. security clearance.

EXPERIENCE

Software Developer, Level 4 | Optimal Blue, Dallas, TX (remote) 2019 – present

Started as an intern (2019). Promoted to Level 1 (2020), Level 2 (2022), Level 3 (2024) and Level 4 (2026).

- I worked on our flagship application, replacing our legacy .NET Framework application, from a greenfield project to a stable brownfield project with most of our clients migrated. I started on the team as an intern and became one of the lead developers.
- I built real-time web applications with SignalR, including live streaming of integration updates to the UI and streamed responses in an LLM chat application.
- I managed Azure environments, deployments, and networking, including VNets, private endpoints, DNS, Traffic Manager and load balancers. I developed our cloud infrastructure with infrastructure as code using Bicep templates.
- I led our team's move from classic Azure Pipelines to YAML pipelines in version control, and build times dropped 50%. I built the proof of concept, migrated our team, presented our approach to other teams and advised them through their own migrations. In 2026 our team moved from Azure DevOps to GitHub, and I planned our GitHub Actions approach with the DevOps team.
- I led the move of the whole organization's automation test suite from Selenium and Postman to Playwright. I created a proof of concept, migrated our team, and gave guidance to other teams.
- In 2026, my team led a cross-organization effort to move our UI components into a shared Angular library, thoroughly designing and testing to make the library extensible and easy to use.
- Designed and shipped an agentic LLM chat application that lets mortgage clients query large datasets in plain language, using Semantic Kernel, Azure AI Services and RAG. Led the company AI hackathon.
- I configured our very complex system with .NET Aspire and Docker dev containers so a new dev can onboard by just cloning the repo and clicking run, with clear onboarding docs.
- I often push to cut back our tech debt and am one of the main instigators of those efforts, including upgrading legacy applications to current .NET and Angular versions.
- I handle production hotfixes and am the last-resort on-call expert when clients have problems they can't resolve.
- I made an effort to mentor devs whenever I could and always had at least one dev under me as a mentee. Some of my mentees have been promoted and others hired elsewhere into higher roles. I review code across teams, give internal lunch and learns, interview engineering candidates and regularly advise other teams.

Software Developer Intern | Ayoka Systems, Dallas, TX Dec 2018 – May 2019

- Built full stack, cloud-first, client-facing web applications in TypeScript and .NET.

SKILLS

Languages and frameworks: C#, .NET 10, ASP.NET, Entity Framework, TypeScript, JavaScript, Angular, Node.js, SignalR (WebSockets), SQL, Python (scripting), Swift (personal projects)

Cloud and infrastructure: Azure (App Services, Functions, Cosmos DB, SQL, VNets, private endpoints), Bicep, Docker, dev containers, .NET Aspire

Delivery and testing: GitHub Actions, Azure Pipelines (YAML), Playwright

AI: Semantic Kernel, Azure AI Services, RAG, agents; AI-assisted development with Claude, OpenAI Codex and GitHub Copilot

EDUCATION

University of Texas at Dallas, B.S. Computer Science 2020

Capstone: led a student team that built a desktop application running machine learning scans for medical research, working with a faculty professor.

Southern Methodist University, Full Stack Web Development Bootcamp 2019

Bishop Lynch High School, Dallas, TX 2016
